

DAMLINES

Landrace-Line 12

PROLIFIC, EXCELLENT MOTHERS

The Rattlerow Landrace lines have been developed over 60 years through intensive testing and selection for reproductive traits. The breeding programme uses BLUP analysis across a large population of nucleus and multiplication herds to calculate a number of important dam line breeding traits.

Numbers born and reared, birth and 21 day weight, feed intake, physical soundness and regular breeding under commercial environments are key factors measured and used within the Rattlerow BLUP programme. Collaboration of the genetic lines and selection programme with RaSe NV has brought about a significant increase in the productivity of this line and ensures our customers benefit from a lift in prolificacy.

The Rattlerow Landrace possesses a keen appetite and excellent mothering ability and has proven to produce outstanding numbers born and reared across a wide range of conditions. She is the

ideal component of any dam line breeding programme.

- **Excellent mothering ability**
- **Outstanding numbers born and reared**
- **High feed intake**
- **Regular breeding**
- **Good lean growth and feed efficiency**
- **Robust, uniform piglets**

Maternal Line GP AI from top performing Rattlerow Landrace boars is available from a number of our high health EU licenced

Klasse AI studs. The GENmatch programme permits breeders to operate a closed herd policy for the production of parent gilts on their own farms. Please contact us for further information.

GENmatch and Klasse Ai

The GENmatch system offers farmers the ability to introduce highly prolific dam line semen, from Klasse Ai, in a cost effective way to produce their own purebred stock and to breed any of the three Rattlerow parent gilts. The system allows producers to operate a closed herd policy or to greatly reduce incoming stock in order to stabilise and safeguard health. It also allows units to keep genetically close to the company nucleus and maintain genetic progress.

Farmers may either introduce the GENmatch system without any introduction of purebred females by undergoing a grading up process though AI only. Alternatively, customers wishing for a more rapid programme, may opt for introduction of high health purebred dam line gilts direct from a nucleus herd after a full veterinary consultation.

Rattlerow takes great pride in the reputation it has gained over many years for the quality of its stock. Great emphasis

is placed on the nutrition and housing of young gilts to ensure their correct development and to maximise their breeding life and calm temperament. Strict selection of stock focusing on teats, feet, legs and body conformation is recognised as a key component in delivering a quality product.

Rattlerow understands that not all farms experience the same financial advantage by focusing exclusively on high numbers born and have therefore taken a balanced approach to selection within their hyperprolific

programme. Some breeders want to maximise numbers born and reared whilst others will wish to focus on producing higher weaning weights with less piglet mortality and variability. Rattlerow have therefore developed three parent lines, Whiteland, Whiteroc and Landroc. These lines allow customers to match their requirements to their own financial situation and choose the best parent gilt to maximise profitability.

Genetic progress over the last 20 years
